## Worksheet - Lab 10

1. What command do you use to change directories from the command line?
2. What commands allow you to go to a directory and check what is inside your current directory?
3. What is the difference between the syntax of one equals sign (=) vs. a double equals sign (==) in Python?
4. What is 0-indexing, and why is it relevant to string manipulation in Python? Show how to create a substring from a string.
5. Explain what this code does: `list(range(2, 6))`
6. Run the “python functions.py all” command to check that all the lab exercises work. Submit this file to the dropbox.
